

Bangalore – 560 012 URL: http://www.civil.iisc.ernet.in/~nagesh Outline
Geographic Information System (GIS)
Digital Elevation Model (DEM)
Integration of RS, GIS, DEM and Hydrological Models
Remote Sensing in Watershed & Water Quality Models
Case Study: AV SWAT for Malaprabha
Conclusions

### Introduction

### Models vary in many ways

- Time step, scale, whether the model simulates single event or on a continuous basis, and how different components are computed.
- For example, for NPS (Non Point Source) modeling, the only feasible option is to incorporate a continuous approach. Loadings from a watershed area need to be represented over time, not just for a single event or single point.

## Components

- Rainfall Estimation
- Rainfall-runoff modeling
- SCS CN Method
- Routing of the runoff
- St. Venant's equation
- Sediment yield
- USLE
- Chemical transport
  - Nitrogen and Phosphorus

### Rainfall Estimation

- Delineating the boundaries of areas likely to get rain
- Assessing basin rainfall totals over time
- Assessing extreme events of rainfall
- Assessing the climatology of rainfall distributions
- Forecasting of rainfall especially in regions with sparse data

- $10.5 12.5 \,\mu\text{m}$
- Microwave (MW) : 0.81 to 1.55 cm

NOAA, GOES, GMS, Meteosat, INSAT

### Rainfall-Runoff Studies

- RS data is used either as a hydrologic model input or for the determination of model parameters
- Need to develop structures of hydrological models, which are amenable to the spatial and temporal resolution provided by RS data
- SCS CN depends on the hydrological soil group and land use description
  - RS provides these inputs

# Watershed Planning and Management Physiographic measurements from RS Watershed area, size and shape, topography, drainage pattern and landforms Wavelengths: 0.6-0.7 µm & 0.8-1.1 µm Stereoscopic attributes for basin topography Information on drainage network/ pattern Lithology and structure of the basin Stream orders, stream length, stream frequency, bifurcation ratio, stream sinuosity, drainage density and linear aspects of channel systems

### Watershed Planning and Management

- Watershed degradation of soil and land resources
- SRS for mapping of soil degradation involving salinity/alkalinity, water logging, erosion, desertification, shifting cultivation, excessive permeability, wet lands etc
- Growth of desertification, flood damage area and encroachment of ravines on agricultural lands

12

### **Erosion Features from RS**

- Erosion potential associated with changes in vegetation and litter
- Changes in soil type and soil color
- Occurrence of dendritic soil patterns
- Occurrence of sand dunes
- Definition between bare soil or rock and
- Vegetal cover

# Soil Salinity

- Causes for soil salinity problems
  - Rising water tables due to recharge from irrigation canals and watered fields
- Naturally poor groundwater quality
- Rock weathering

### Salinity effects in irrigated areas

• stunted crop growth, poor and patchy germination, crop stress, death of crop, encroachment of halophytic species, bare soils with efflorescence and salt crust development

# Soil and Water Assessment Tool (SWAT)

- SWAT is a river basin, or watershed scale model (Neitsch et al., 2002)
- Physically based & Continuous time model
- To predict the impact of land management practices on water, sediment and agricultural chemical yields in large complex watersheds with varying soils, land use and management conditions over long periods of time.
- Due to its easy adaptability to situations with limited data availability, it has become very popular even to study the climate change impact on a river basin scale

### SWAT - Advantages

- Watersheds with little monitoring data (e.g. no stream gauge data) can be modeled
- Relative impact of alternative input data (e.g. changes in management practices, climate, vegetation, etc.) on water quality or other variables of interest can be quantified
- Computationally efficient. Simulation of very large basins for a variety of management strategies can be performed without excessive investment of time or money.
- Enables users to study long-term impacts. Many of the problems currently addressed by users
  - Involve the gradual buildup of pollutants
  - · Impact on downstream water bodies

### Concluding Remarks

- Strong potential for use of remote sensing, GIS & DEM for water resources planning and management
- Proper image processing of remotely sensed data, DEM and spatio-temporal analyses with GIS would be very effective for better understanding and management of water resources.
